

ProShop Bridge Tampermonkey Debug Session

Date: 2026-03-13

Machine: Garrett's ASUS workstation

Script: ProShop Bridge / Paste Written Description (Tampermonkey)

Problem

Garrett could not see the orange **PS Bridge: Active** badge or the blue **Paste Written Description** button on Written Description pages in ProShop.

Diagnostic Steps

1. Confirm Tampermonkey is Running

- Opened Chrome DevTools (F12) → Console tab
- Typed `document.title` → returned page title, confirmed console was live
- Checked Tampermonkey icon in toolbar (found via  puzzle piece → pin icon)
- **Result:** Badge showed "1" → script is executing

2. Navigate to the Correct Page

- Script only fires on Written Description pages, not the Production Home
- Navigated to: NP000674 / Op 60 / Written Description
- URL pattern required: `traxismfg.adionsystems.com/procnc/parts/{customer}/{part}?formName=writtenDescription...`
- **Result:** Correct page loaded, but no badge or button visible

3. Check Console for Errors

- Issues tab showed: **"Deprecated feature used"** (1 warning)
- First `querySelector` attempt failed due to curly/smart quotes (copy-paste issue) — use

straight quotes when typing console commands manually

- Second attempt failed with: `document.querySelector` is not a function — console was scoped to an iframe context, not the top page
- Fixed by verifying “top” was selected in the context dropdown

4. Check for Written Description Field

```
document.querySelector("textarea")  
// → null
```

No textarea found on the page.

```
document.querySelector("[contenteditable]")
```

```
document.querySelectorAll("iframe").length
```

(Results pending at time of writeup)

Current Hypothesis

The Written Description editor is **not a standard textarea**. It is likely either:

- A `contenteditable` div (rich text editor)
- Embedded inside an **iframe** that the Tampermonkey script cannot access from the top-level page context

If `querySelectorAll("iframe").length` returns `> 0`, the script needs to be updated to target the correct iframe's `contentDocument` rather than the top-level `document`.

Next Steps

1. Confirm iframe count on the Written Description page
2. If iframes exist, identify which one contains the editor:

```
document.querySelectorAll("iframe")[0].contentDocument.querySelector("textarea")
```

3. Update the Tampermonkey script to look inside the correct iframe context
 4. Re-test button injection after script update
-

Notes

- `querySelector` is case-sensitive — capital Q and capital S required
- Always use straight quotes " not curly quotes " in the DevTools console
- The "Deprecated feature used" warning in the Issues tab may be from the Tampermonkey script itself and is worth investigating separately
